

I should already know:

- How seeds and bulbs grow into mature plants
- How plants need water, light and a suitable temperature to grow and stay healthy.

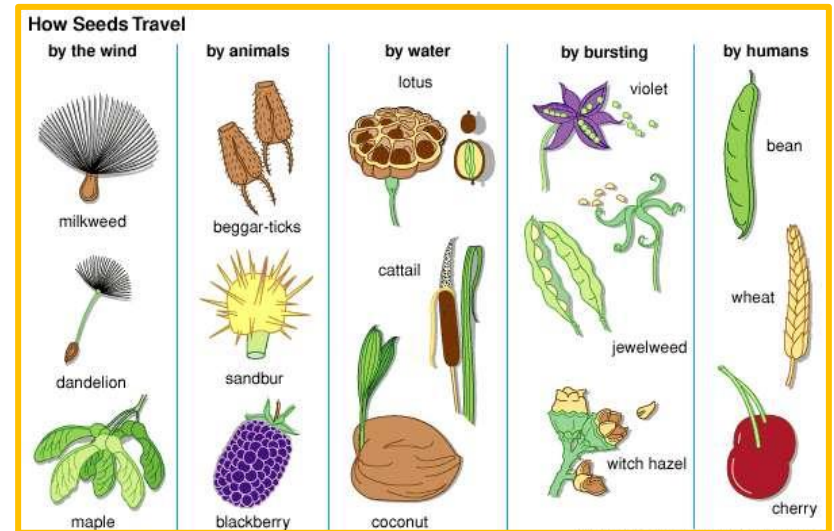

Plants

Biology

Pollination – moving pollen from one plant to another to fertilise it
 Germinate – the seed begins to grow

root	Absorb water and nutrients from the soil Supports the plant to keep it anchored
stem	Supports the plant Carries water from the roots to the rest of the plant
leaves	Use sunlight to provide the plant with energy
flower	Creates seeds, makes pollen, attracts bee
nutrients	substances needed by living things to grow and survive

Seed dispersal – how seeds are moved / spread / scattered away from the parent plant
